Regional Analysis Report

Journal of Innovative Analytics

ISSN 1234-567X   eISSN 4321-7658

This report provides data on the geographical diversity of the journal's authorship, the leading country/regions, and the impact of each in the journal and subject. The report helps identify which countries/regions underpin a journal's performance.

The report includes the supporting datasets from InCites Benchmarking & Analytics for further analysis.
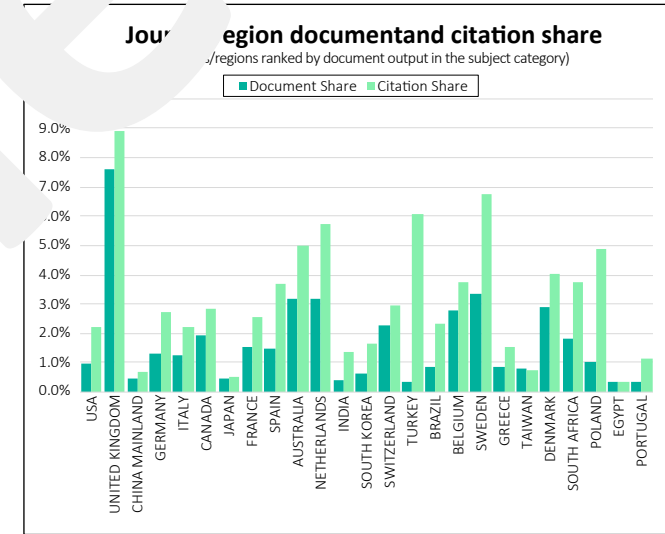

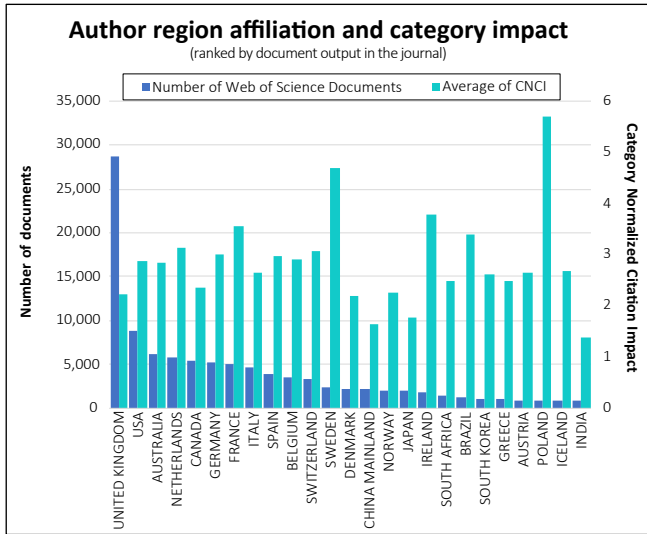

THIS IS A SAMPLE REPORT.

Journal of Innovative Analytics
Regional Analysis (2014–2018)

Web of Science Group

Global Authorship and Geographical Diversity
based on the affiliations of all listed authors

Author region affiliation and category impact
(ranked by document output in the journal)

Legend: Number of Web of Science Documents | Average of CNCI

Author region affiliation and percentage international collaborations

Legend: Number of Web of Science Documents | Sum of % International Collaborations

Journal region document and citation share
countries/regions ranked by document output in the subject category

Legend: Document Share | Citation Share

Author Region Affiliation and Category Impact
The category normalized citation impact (CNCI) of coutries/regions ranked by number of documents in the journal. This shows the relative contribution of countries/regions to the journal's subject category. Note that each author is indexed, so a single paper may have authors affiliated with multiple countries/regions (and a single author may have more than one affiliation).

Author Region Affiliation and Percentage International Collaborations
The percentage of papers with an author from the specified country/region that has an author affiliated with other countries/regions. This illustrates international collaboration and diversity in the journal.

Journal Region Document and Citation Share
This shows the journal's share of output from the leading countries in the category. For journals in more than one category, this is the lead category – the one in which the journal is most highly ranked or the category you requested.

Number of countries	
contributing countries in journal	68
contributing countries in category	199

Using Normalized Citation Impact
Citation patterns vary – citations accumulate over time, some document types (e.g. reviews) are more likely to be cited, and citation rates depend on the subject/journal. Normalization ensures that papers are compared with similar papers: the same document type, publication year and journal or category/categories. Journal Normalized Citation Impact (JNCI) and Category Normalized Citation Impact (CNCI) will generally correlate, JNCIs are proportionally lower for high impact journals as the number of expected citations will be higher.

An NCI is a ratio of actual to expected citations: an NCI of 1 indicates that a document or group of documents is receiving the expected number of citations, an NCI of 2 that it is receiving twice the expected, and 0.5, half that expected.

As NCIs are averages, a single or small number of highly cited papers can significantly influence the value.
